Teradata

# Webinar Overview

The field of business analytics is undergoing massive change as disruptive technologies such as analytic appliances, non-relational systems, cloud computing and big data analytics are introduced by vendors. What is often forgotten in the rush by vendors to market these new technologies is that many organizations are struggling with performance demands, governance issues and satisfying user requirements using their existing data warehouse and analytics environment and may not have the resources to take advantage of new industry developments. Also, new technology may not solve existing problems and may even exacerbate them if implemented incorrectly. This web seminar examines the issues in deploying business analytics today and discusses an analytics roadmap that can help organizations modernize their data warehouses and take advantage of both existing and new analytic technologies. Topics that will be covered include:

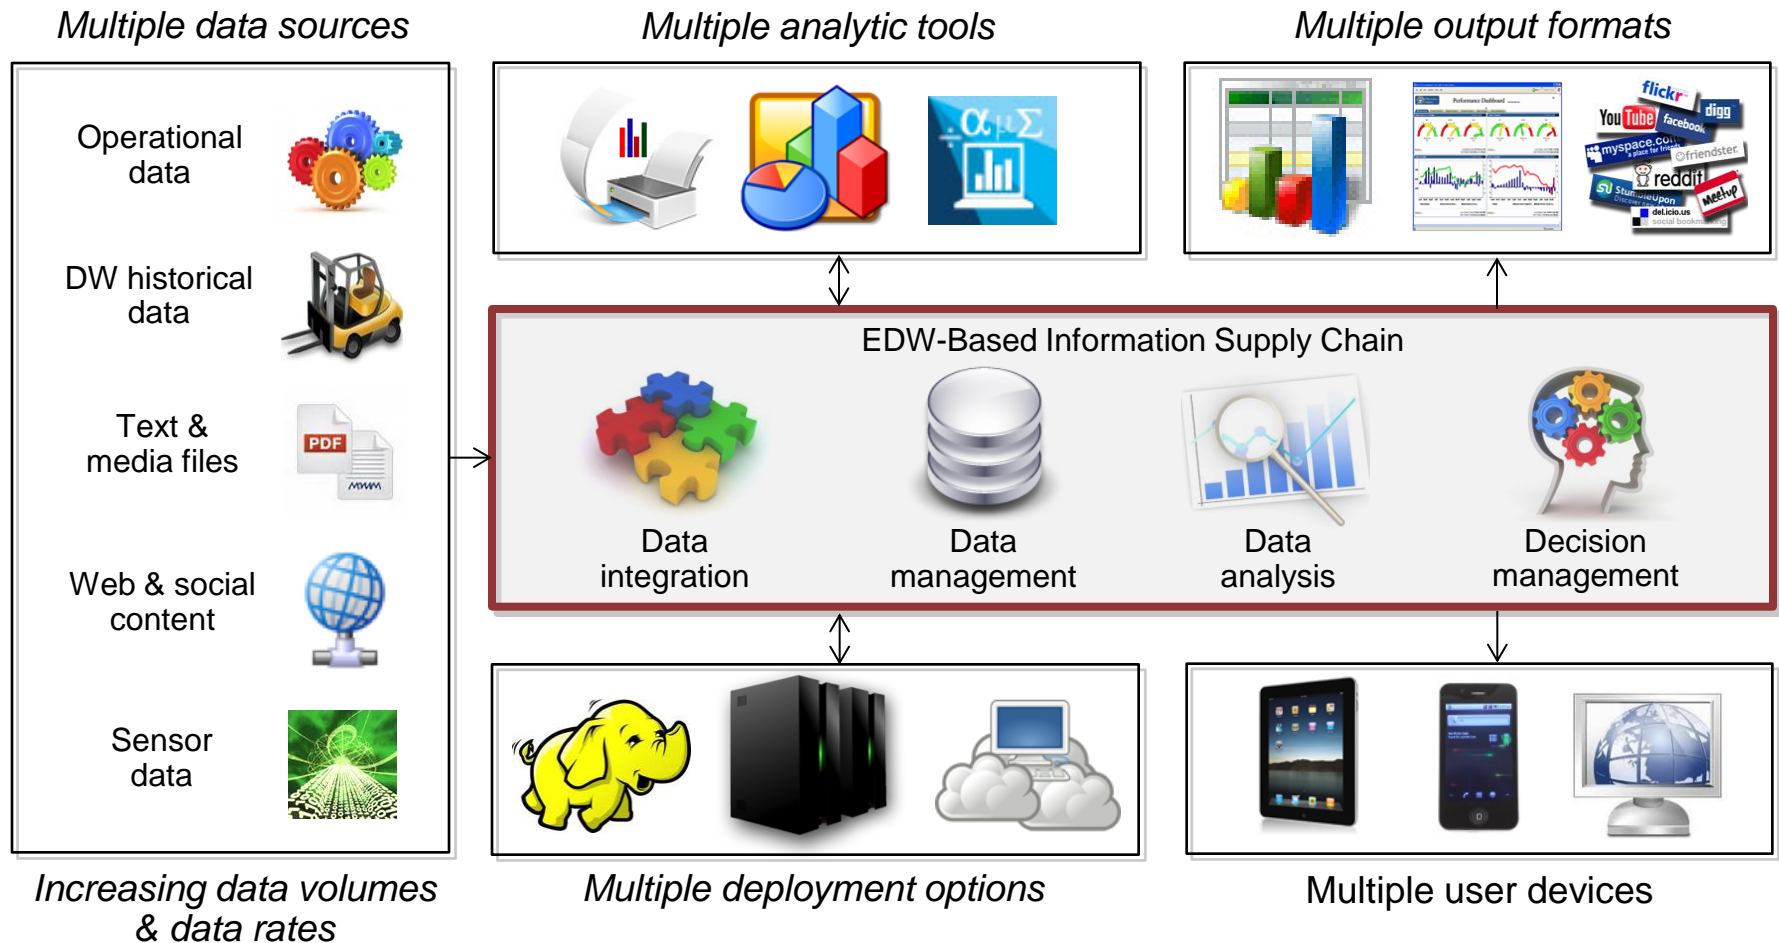

- Modernizing the traditional data warehouse
- Using new technologies to enhance existing analytic approaches and gain business benefit
- Finding the right balance for data governance
- An analytics roadmap for the modern data warehouse

# The Traditional EDW Information Supply Chain

1. Data must be integrated into the EDW before it can be analyzed
2. Process can be time consuming and IT can become a bottleneck
3. EDW initiatives are often IT and not business driven
4. Results are often not what users want
5. Leads to short-term LOB initiatives and data silos that reinvent the wheel

# Building an EDW is Becoming More Difficult

# Solving the Problem

Need to modernize the EDW environment to leverage technology for business value

Continue to use analytics to improve existing operational processes

But also at the same time look for new opportunities to address changes in the business climate and business goals

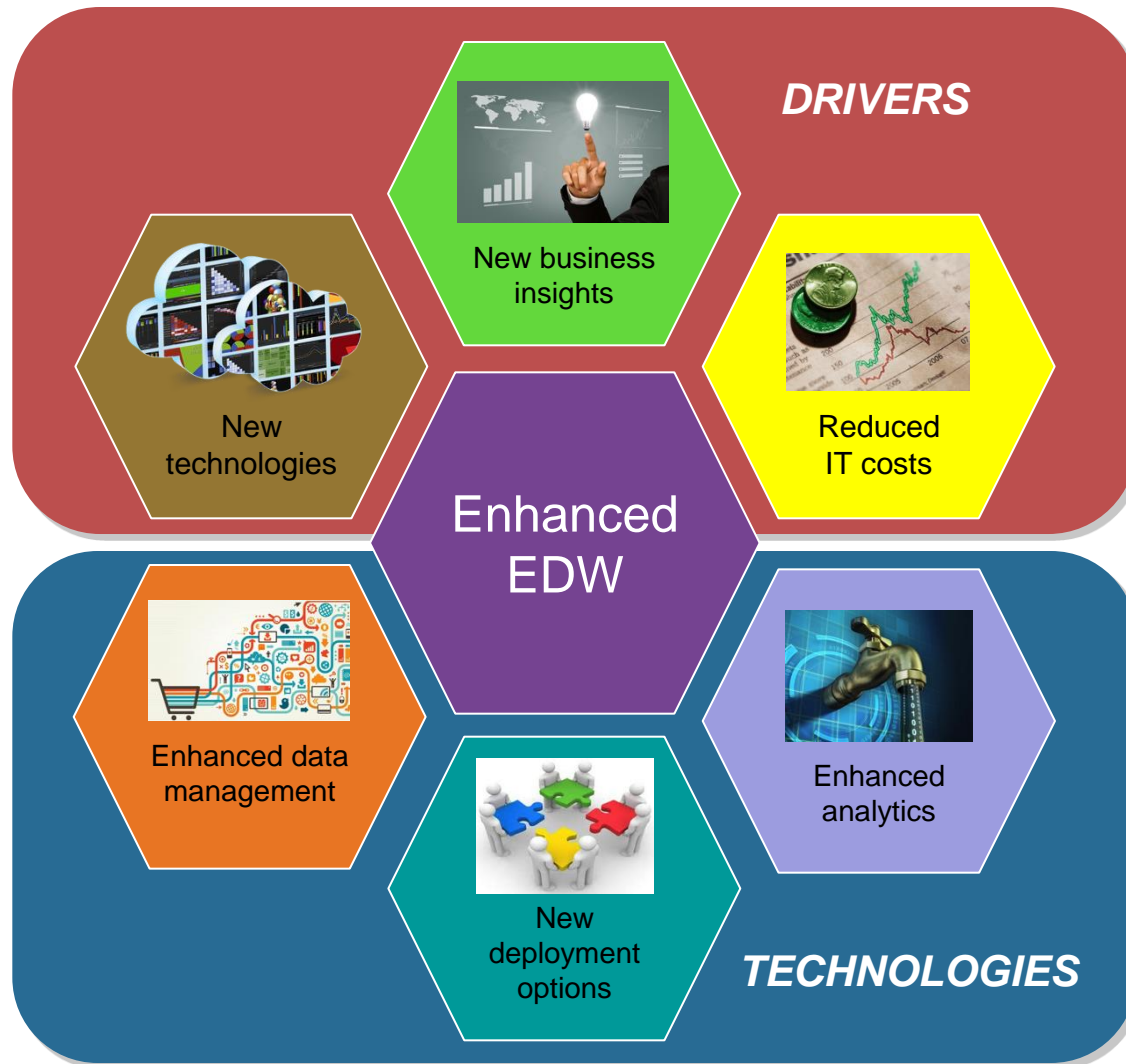

Invest in investigative computing (i.e., data discovery or analytics R&D)

Aim to reuse data and analytic components where possible

Adjust governance policies and procedures to support the enhanced EDW environment

Develop an analytics roadmap based on business needs and goals

# Exploiting New Technology for Business Value

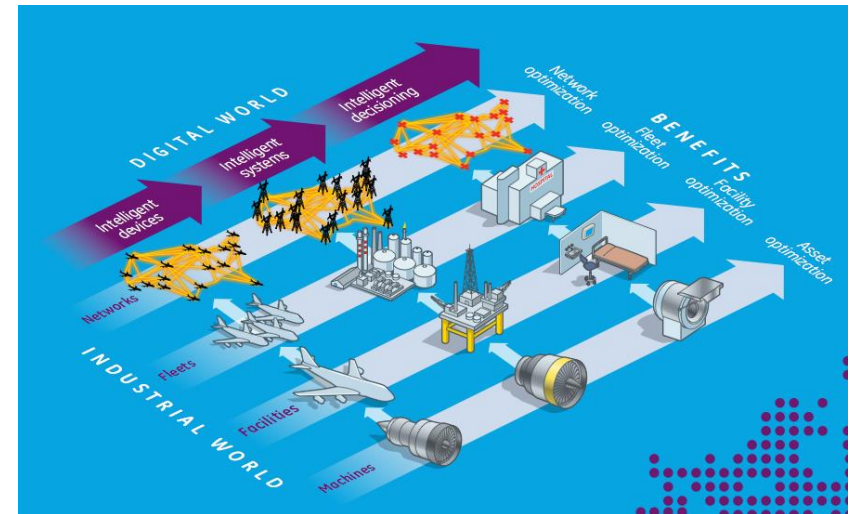

# New Insights: Examples

## Today

- Situational 1-to-1 marketing: micro-segmentation, cross-channel analysis, analysis of influential factors
- Customer experience and perception management
- Fraud detection, risk management and compliance

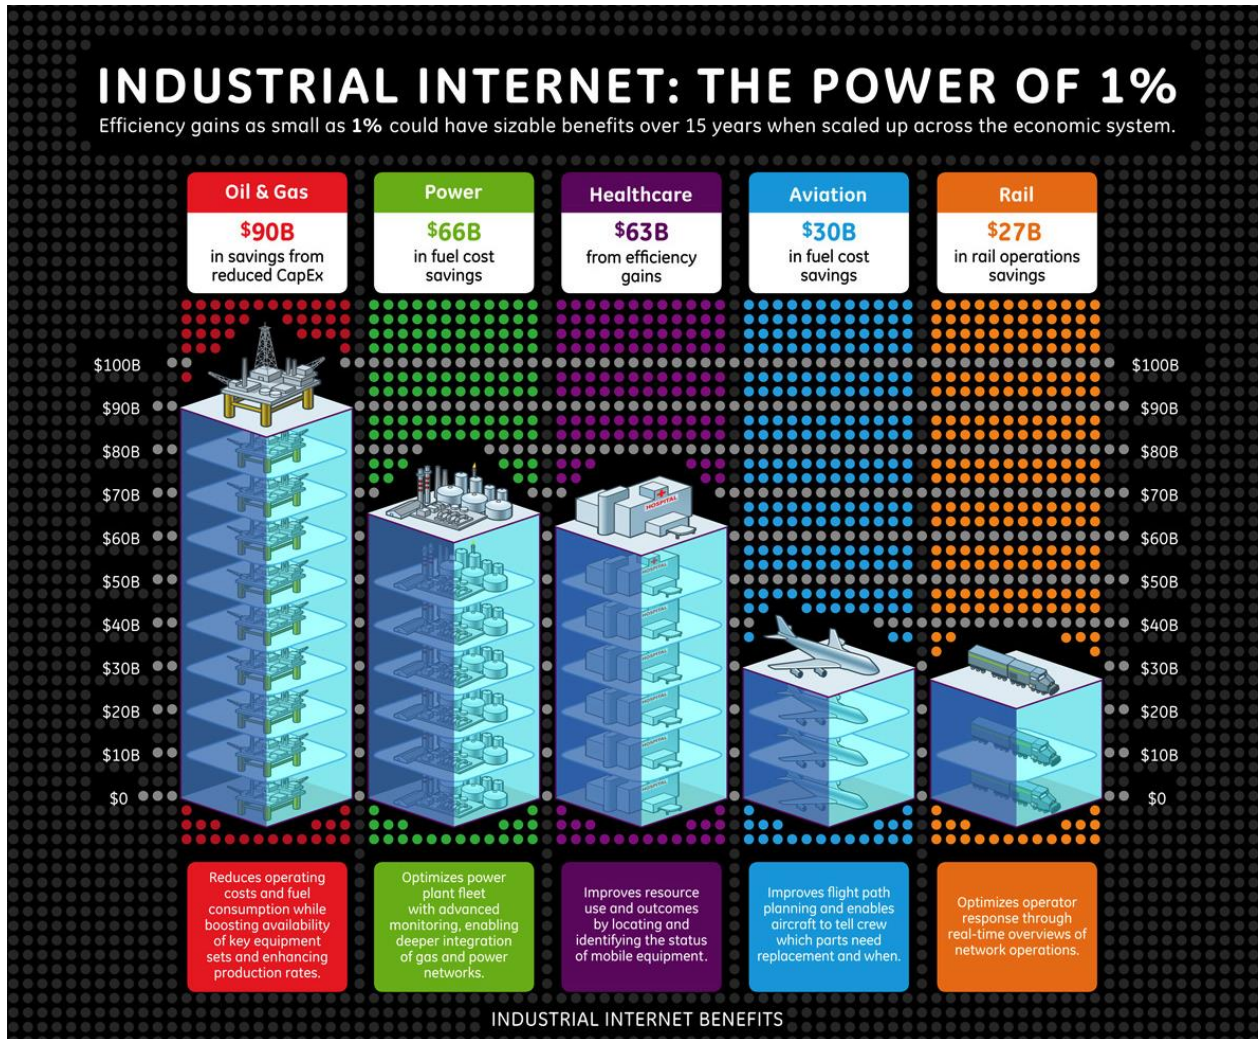

## The Trend

- The “Internet of Things:” the processing and analysis of sensor and event data (healthcare, telecommunications, financial services, engineering, etc.)

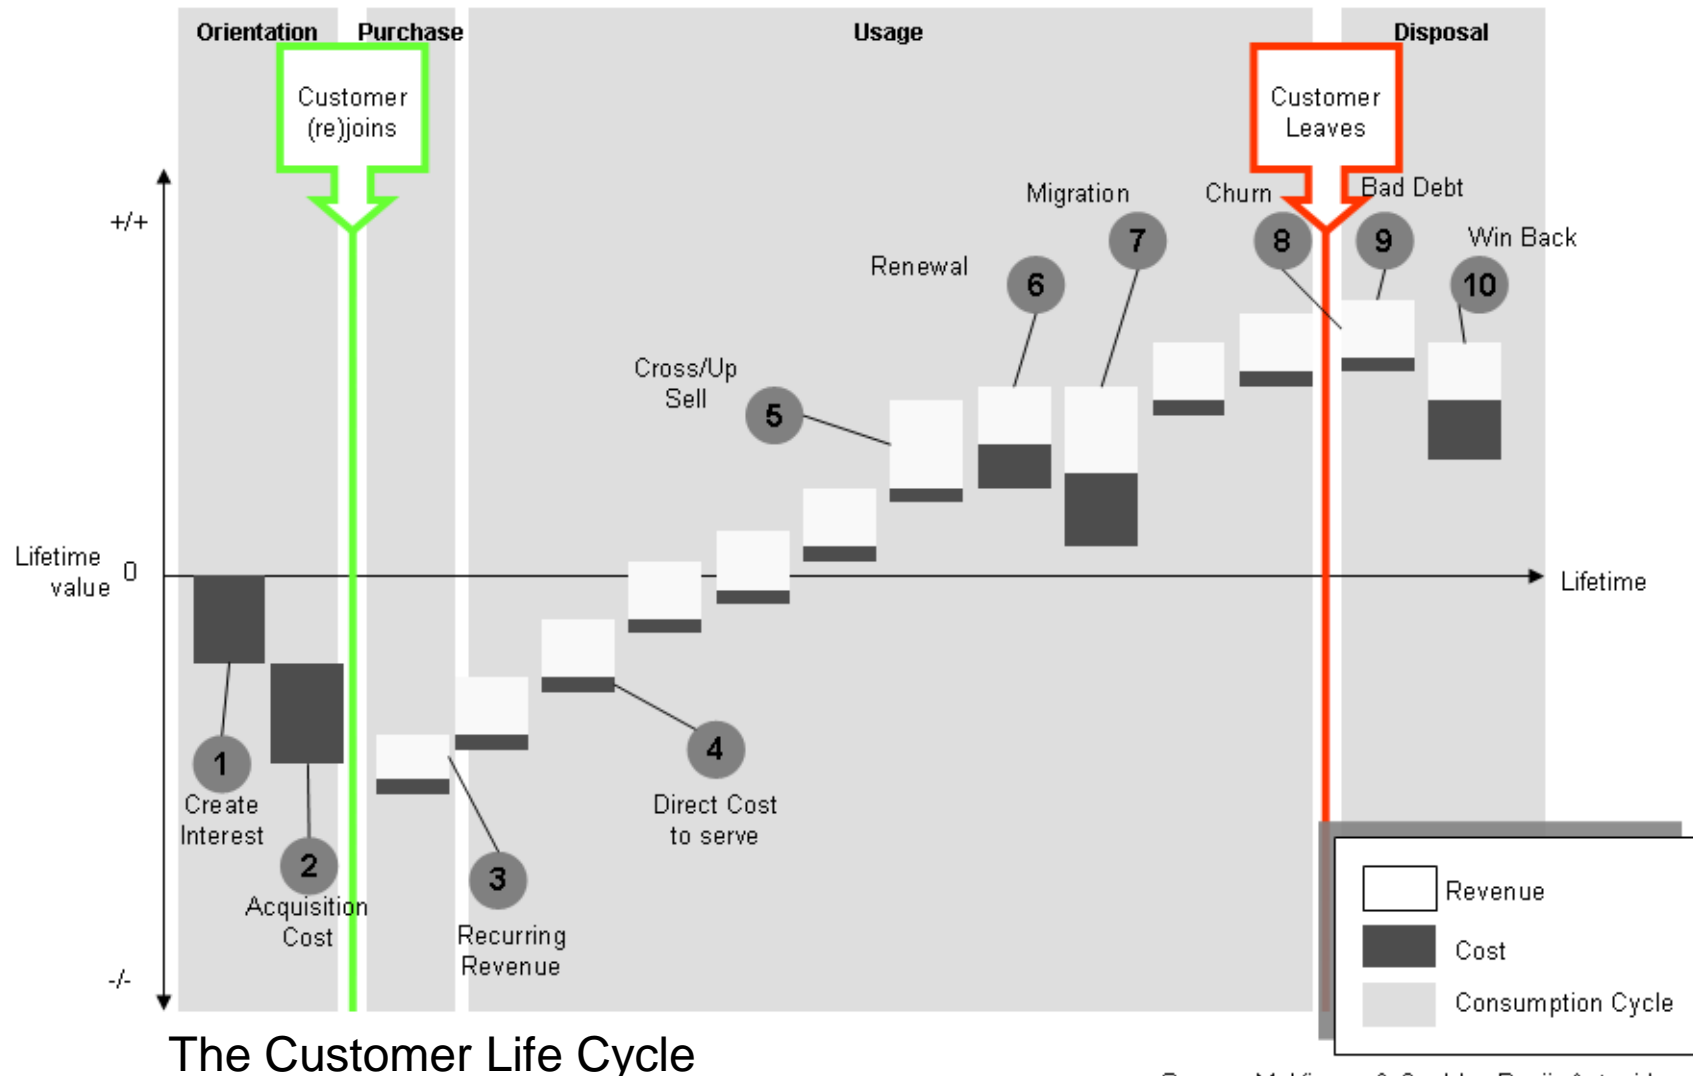

GE: “Industrial Internet: Pushing the Boundaries of Minds and Machines”

# New Insights Where Next? GE Example

# Quick Wins vs. Strategic Goals: Example

Source: McKinsey & Co; Van Raaij, Antonides

# Customer Analytics: Quick Win Examples

## Quick Wins

- Use social media analytics to evaluate customer perception about products and services
- Analyze web site traffic to explore customer behavior
- Understand how customer buying patterns are affected by season, weather, store location, store layout
- Use a temporary data lab to analyze approaches to market a new product

## But ...

- How do these short-term gains satisfy the long-term goals of increasing revenue and reducing costs?
- Do business users understand the results and how to use them to gain business benefit?
- Are the results consistent across projects?

# New Technologies

## Enhanced Data Management

- New data sources (big data)
- Analytic relational DBMSs
- Non-relational systems (e.g., Hadoop, HBase, MongoDB, CouchDB)
- Improved price/performance

## New Deployment Options

- Integrated H/W & S/W appliances
- Cloud computing
- Mobile devices (mobile first strategy)

## Enhanced Analytics

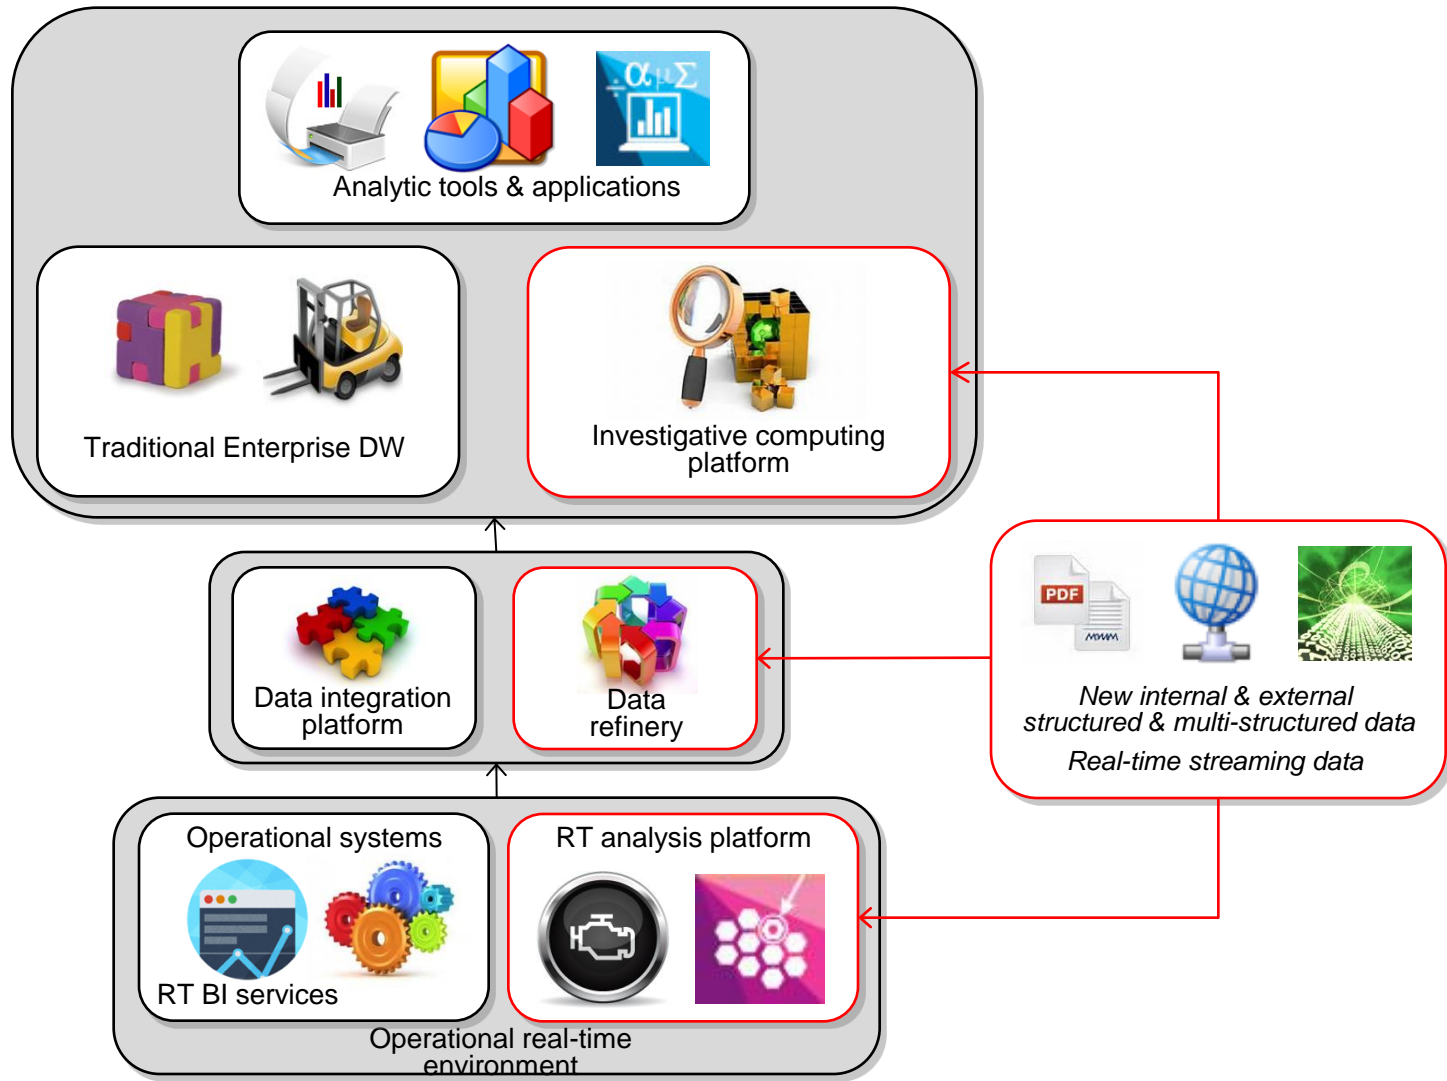

- Investigative computing
- Predictive & prescriptive analyses
- Enhanced visualization

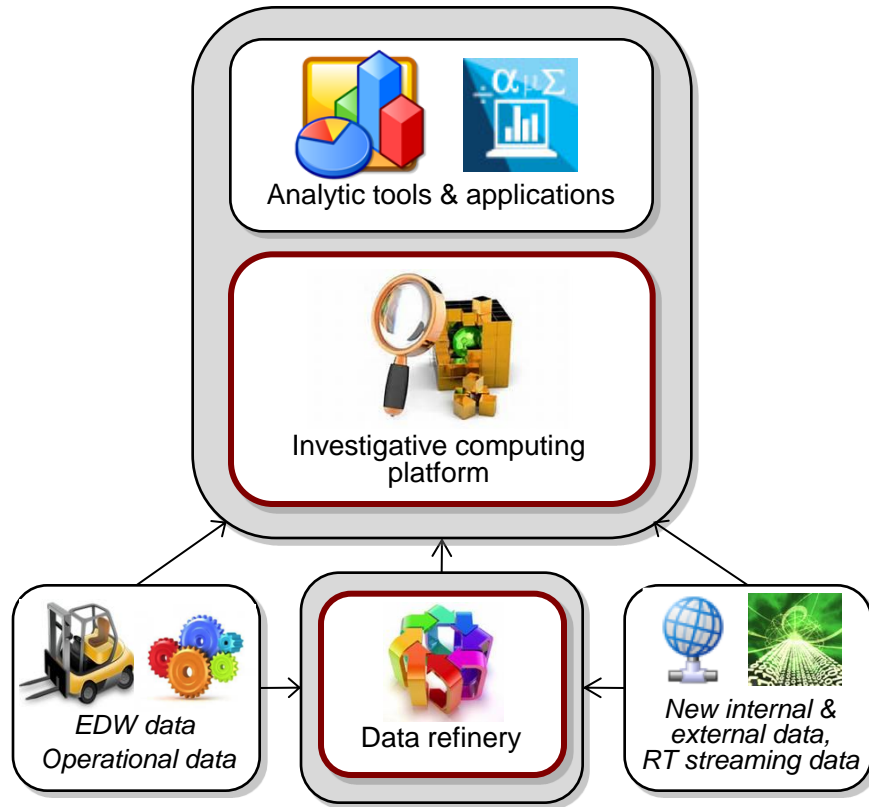

# The Risk of New Technologies

# Modernizing the EDW

# Key New Components

## Investigative Computing Platform

- Used for exploring data and developing new analyses and models
- May also be used for prototyping new analytics-driven LOB applications and for temporary analytic solutions
- May employ an RDBMS or non-relational system such as Hadoop

## Data Refinery

- Ingests raw detailed data in batch and/or real-time into a managed data store
- Distills the data into useful information and for use by other systems
- May also be used for data archiving and for creating a “queryable” archive
- Key use of non-relational systems today

# The Role of Investigative Computing

Enables users to blend new types of data with existing information to discover ways of improving business processes and to look for new business opportunities

Allows users to experiment with different types of data and analytics before committing to a particular solution

May employ a RDBMS or non-relational solution running on premises or in the cloud

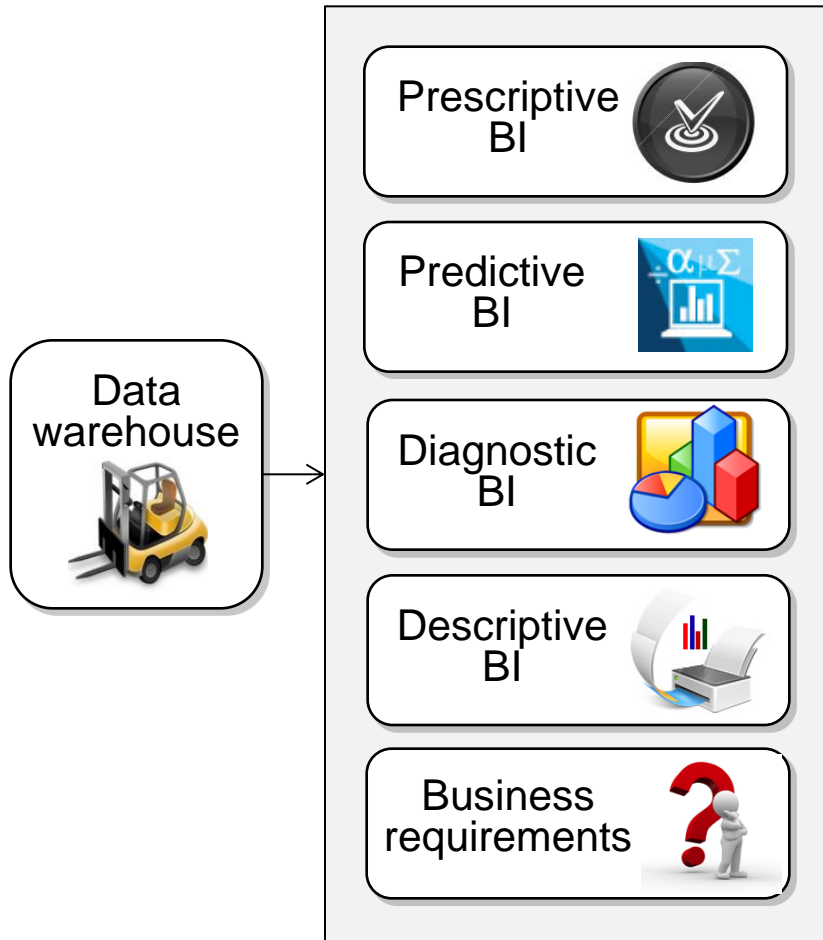

Represents a shift in the way organizations build analytic solutions:

- Increases flexibility and provides faster time to value because data does not have to be modeled or integrated into an EDW before it can be analyzed
- Extends traditional business decision making with solutions that increase the use and business value of analytics throughout the enterprise

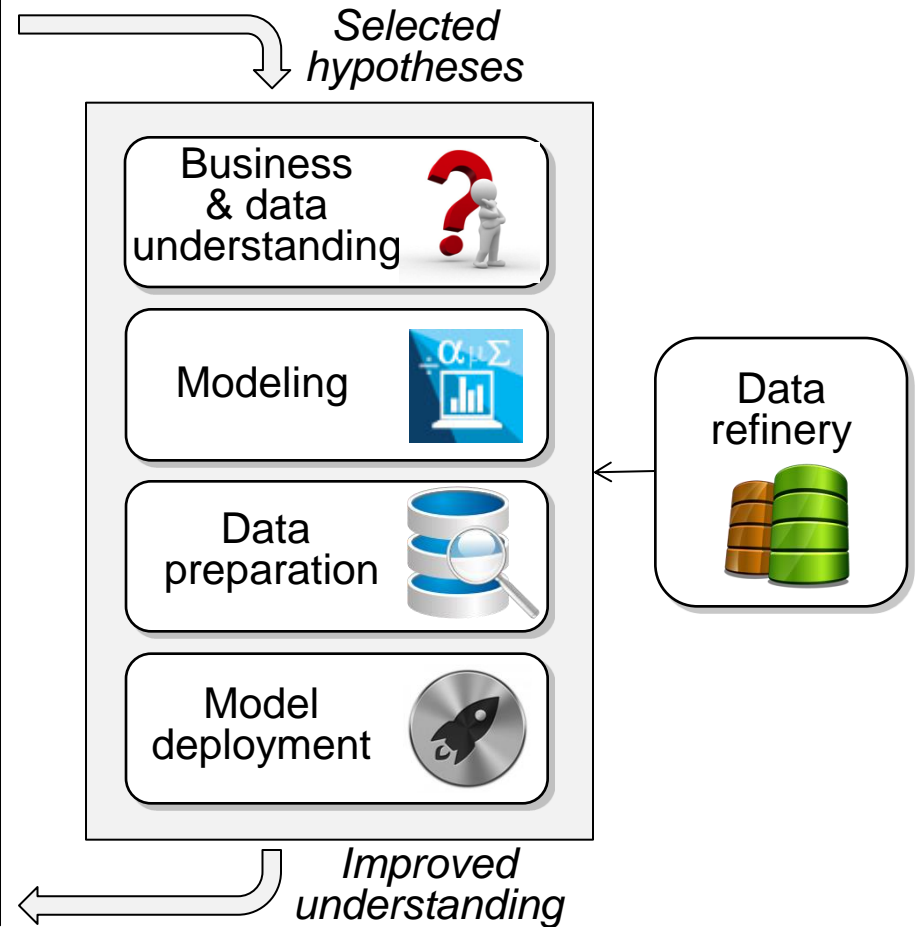

# Investigative Computing Extends the EDW

## Production EDW

## Investigative Computing

# Customer Analytics: Production EDW

Descriptive: How many of customers churned in the last month?

Descriptive: How many of these were profitable?

Diagnostic: Why did these profitable customers churn?

Predictive: How many profitable customers are likely to churn next month?

Prescriptive: How can we reduce this profitable customer churn rate?

# Customer Analytics: Investigative Computing

Business and data understanding: What is the difference between a highly profitable customer and an average customer?

Data preparation and modeling: What are the characteristics of a highly profitable customer?

Deployed predictive model: Will this new customer be profitable?  
How much revenue is this new customer likely to generate?

# Data Governance Considerations

No longer practical to rigidly control and govern all forms of data and analytics – a modernized EDW allows different levels of governance to be applied based on security, compliance, quality and retention needs

# Summary: Gaining Value from New Technologies

Managers don't have to be technical experts, but they need to:

- Understand the fundamental principles well enough to appreciate the business opportunities, communicate with technologists and evaluate proposals for projects
- Be willing to invest in data and experimentation and supply the required resources
- Keep the BI and the data science team on track

Understand how to gain competitive advantage (or parity) from new DW technologies in the context of the corporate strategy and that of competitors

Maintain momentum over competitors

Collaborate with, and examine projects in other organizations

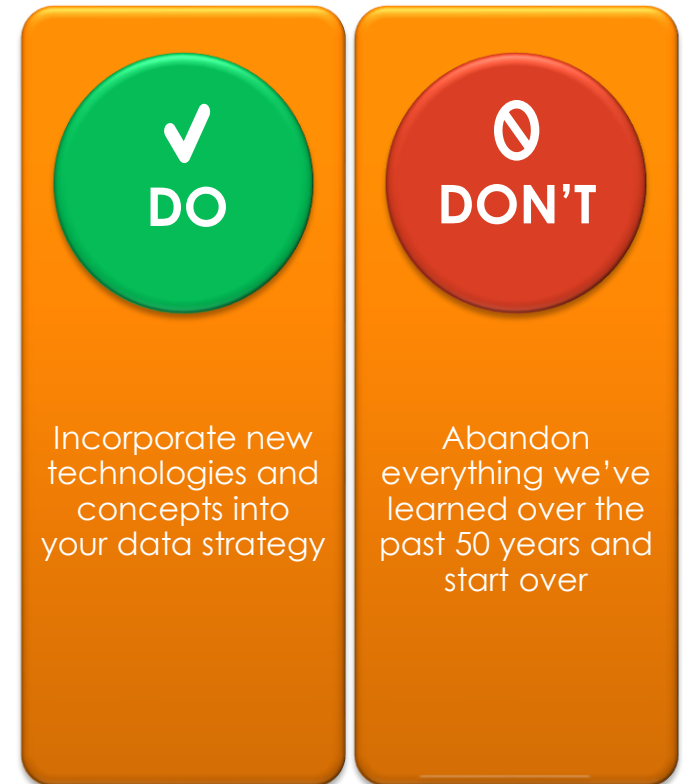

# Developing an Analytic Roadmap

## Combining Proven Practices with Modern Concepts

**Kevin Lewis, Teradata Strategy and Governance**

# The Challenge – Leveraging Technology for Business Value

- Modern data warehouses require the integration of new capabilities and new thinking
- But the key strategic principles still apply and are more important than ever
- *How do you create a roadmap that incorporates proven principles with the latest concepts and technologies?*

## What We Hear – Symptoms of a Bad Strategy

“The business lead says they’re not seeing the return on the investment”

“Data modeling and other project activities take way too long”

“We have a lot of data issues and needs, but we don’t know where to start”

“Databases are not optimized for the right workload”

“Big Data changes everything; we can just put the data out there for everyone”

“Business and IT seem to have different priorities.”

# Strategic Principles

## Successful Data Strategies...

- Plan to deploy only the data and analysis needed when it is needed (by business initiatives)
- Establish principles so that each each project contributes to shared data resources
- Integrate data planning and implementation into the organizational machinery
- Include discovery and experimentation to find value quickly

# Analytic Discovery and Analytic Roadmap

***This is not a technology distinction!***

## Analytic Discovery (Investigative Computing)

**Prospecting –  
Effort to find the gold**

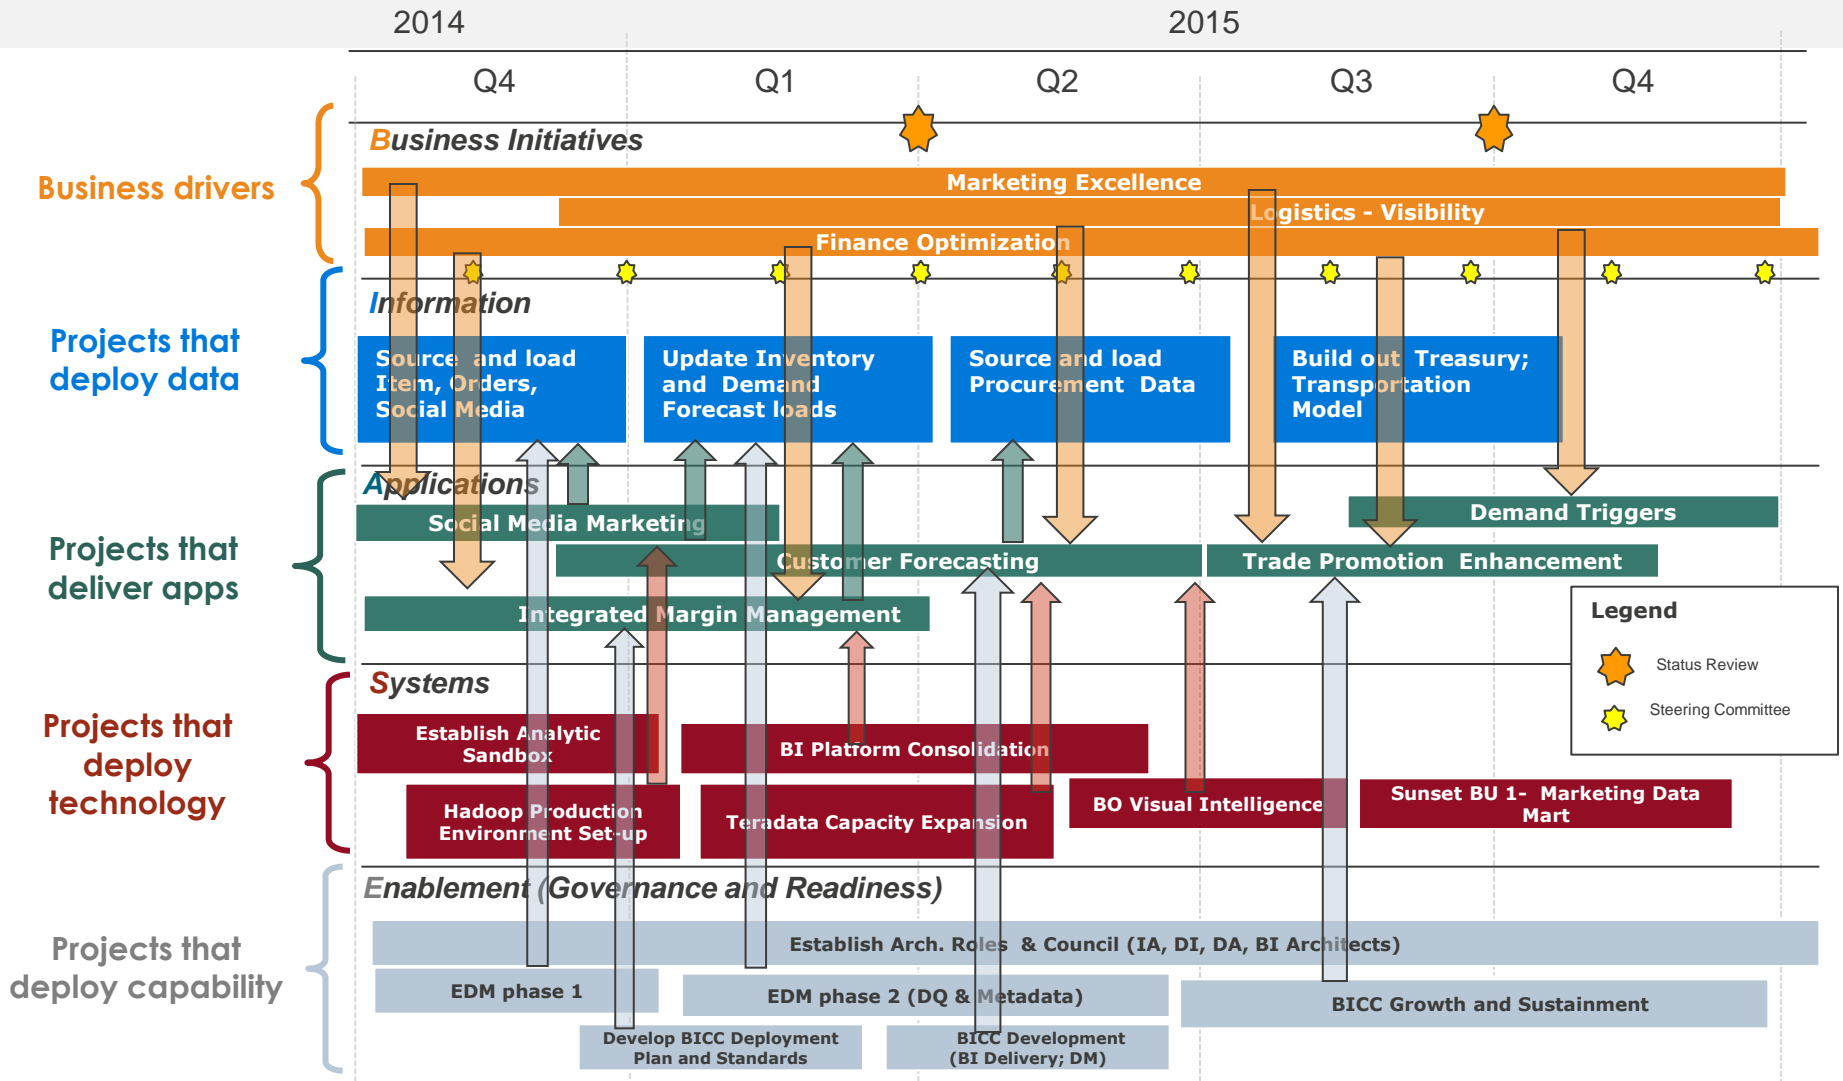

## Analytic Roadmap Projects (Solutions for Production)

**Mining/Production  
Projects to mine the gold**

# The Roadmap in Layers

# What You Can Do Tomorrow -

## Program Planning

*Translate the roadmap into a program plan*

### Business

*Identify business initiatives*

### Information

*Identify data needed for business initiatives*

### Application

*Identify applications to make use of the data*

### System

*Identify infrastructure needed to leverage data and support applications*

*Start by taking a slice through all of these*

## Enablement

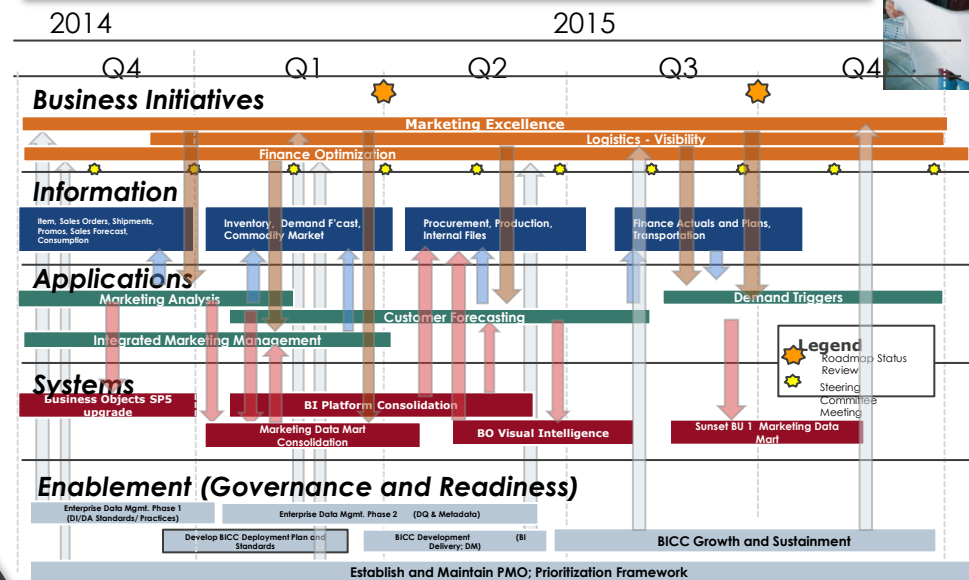

*Identify actions needed to prepare or mature the organization*

# Analytic Discovery and the Roadmap

- Proactively planned
- Linked to strategy
- Role of data asserted in advance
- Includes formal IT projects

- Limited size
- Quick turnaround
- IT support needed but formal IT projects typically not needed

## Strategic Analytic Roadmap

*Results of Analytic Discovery can feed strategy, individual projects, or be directly acted upon*

Analytic Discovery

## DATA AND ANALYTICS STRATEGY

A structured approach to create a roadmap that fully enables analytic solutions to directly impact business priorities.

### What's New

**White Paper: A Tale of Two IT Departments**  
This paper focuses on the incremental business value created by consolidating data from multiple data warehouses.

1 2 3 4

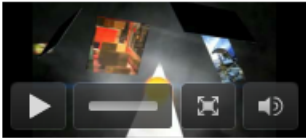

### Gain Alignment Across Your Organization

The business and IT organizations are often driven by different metrics and needs. This, combined with the fact that IT budgets tend to grow 2-3% annually, while the demand for analytics is growing at rates of 50% or more, there are several disconnects about how to move forward. Although both sides may have a vision, it is often unclear how IT initiatives directly support business transformation efforts. While IT projects are often cost-driven, business efforts are often revenue driven. Without bringing together these critical differences and sharing a vision about the how IT and business projects come together to address priorities, you will neither realize the full value from your data nor the full potential of your organization.

**Watch: A Brief Introduction**

### Build a Roadmap to Drive Business Priorities

You have to anticipate the future through predictive analysis, behavioral analysis, and active business intelligence. The ability to be effective requires several building blocks for success. A roadmap is the opportunity for customers to understand what building blocks are needed and how to realize the broader analytics needs. Without this perspective, resources will tend to react only to the issue of the day and will struggle to maintain the pace of day to day business.
